

# Lecture 13: Basic Graph Algorithms

Michael Dinitz

October 8, 2024

601.433/633 Introduction to Algorithms

# Introduction

Next 3-4 weeks: graphs!

- ▶ Super important abstractions, used all over the place in CS
- ▶ Most of my research is in graph algorithms (particularly when graph represents computer/communication network)
- ▶ Great course on Graph Theory in AMS

Today: review of basic graph algorithms from Data Structures, possibly one or two new

# Basic Definitions

## Definition

A graph  $G = (V, E)$  is a pair where  $V$  is a set and  $E \subseteq \binom{V}{2}$  (unordered pairs) or  $E \subseteq V \times V$  (ordered pairs).

## Notation:

- ▶ Elements of  $V$  are called *vertices* or *nodes*
- ▶ Elements of  $E$  are called *edges* or *arcs*.
- ▶ If  $E \subseteq \binom{V}{2}$  then graph is *undirected*, if  $E \subseteq V \times V$  graph is *directed*
- ▶  $|V| = n$  and  $|E| = m$  (usually)
- ▶ So “size of input” =  $n + m$

# Representations

## Adjacency List:

- ▶ Array  $\mathbf{A}$  of length  $n$
- ▶  $\mathbf{A}[\mathbf{v}]$  is linked list of vertices *adjacent* to  $\mathbf{v}$  (edge from  $\mathbf{u}$  to  $\mathbf{v}$ )

## Adjacency Matrix:

- ▶  $\mathbf{A} \in \{0, 1\}^{n \times n}$
- ▶  $\mathbf{A}_{ij} = \begin{cases} 1 & \text{if } (i, j) \in E \\ 0 & \text{otherwise} \end{cases}$

# Representations (cont'd)

Adjacency List:

- ▶ Pros:

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently
- ▶ Cons:

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $\mathbf{v}$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  
 $O(d(\mathbf{u}))$  or  $O(d(\mathbf{v}))$  (where  $d(\mathbf{v})$  is the degree of  $\mathbf{v}$ : # edges with  $\mathbf{v}$  as endpoint)

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $\mathbf{v}$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  
 $O(d(\mathbf{u}))$  or  $O(d(\mathbf{v}))$  (where  $d(\mathbf{v})$  is the degree of  $\mathbf{v}$ : # edges with  $\mathbf{v}$  as endpoint)

## Adjacency Matrix:

- ▶ Pros:

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  
 $O(d(u))$  or  $O(d(v))$  (where  $d(v)$  is the degree of  $v$ : # edges with  $v$  as endpoint)

## Adjacency Matrix:

- ▶ Pros:
  - ▶ Can check if  $e = (u, v)$  an edge in  $O(1)$  time

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  
 $O(d(u))$  or  $O(d(v))$  (where  $d(v)$  is the degree of  $v$ : # edges with  $v$  as endpoint)

## Adjacency Matrix:

- ▶ Pros:
  - ▶ Can check if  $e = (u, v)$  an edge in  $O(1)$  time
- ▶ Cons:

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  $O(d(u))$  or  $O(d(v))$  (where  $d(v)$  is the degree of  $v$ : # edges with  $v$  as endpoint)

## Adjacency Matrix:

- ▶ Pros:
  - ▶ Can check if  $e = (u, v)$  an edge in  $O(1)$  time
- ▶ Cons:
  - ▶ Takes  $\Theta(n^2)$  space: if  $m$  small, lots wasted!
  - ▶ Iterating through edges incident on  $v$  takes time  $\Theta(n)$ , even if  $d(v)$  small.

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  $O(d(u))$  or  $O(d(v))$  (where  $d(v)$  is the degree of  $v$ : # edges with  $v$  as endpoint)

## Adjacency Matrix:

- ▶ Pros:
  - ▶ Can check if  $e = (u, v)$  an edge in  $O(1)$  time
- ▶ Cons:
  - ▶ Takes  $\Theta(n^2)$  space: if  $m$  small, lots wasted!
  - ▶ Iterating through edges incident on  $v$  takes time  $\Theta(n)$ , even if  $d(v)$  small.

This class: adjacency list unless otherwise specified.

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  $O(d(u))$  or  $O(d(v))$  (where  $d(v)$  is the degree of  $v$ : # edges with  $v$  as endpoint)

This class: adjacency list unless otherwise specified.

Any way to improve these?

## Adjacency Matrix:

- ▶ Pros:
  - ▶ Can check if  $e = (u, v)$  an edge in  $O(1)$  time
- ▶ Cons:
  - ▶ Takes  $\Theta(n^2)$  space: if  $m$  small, lots wasted!
  - ▶ Iterating through edges incident on  $v$  takes time  $\Theta(n)$ , even if  $d(v)$  small.

# Representations (cont'd)

## Adjacency List:

- ▶ Pros:
  - ▶  $O(n + m)$  space
  - ▶ Can iterate through edges adjacent to  $v$  very efficiently
- ▶ Cons:
  - ▶ Hard to check if an edge exists:  $O(d(u))$  or  $O(d(v))$  (where  $d(v)$  is the degree of  $v$ : # edges with  $v$  as endpoint)

## Adjacency Matrix:

- ▶ Pros:
  - ▶ Can check if  $e = (u, v)$  an edge in  $O(1)$  time
- ▶ Cons:
  - ▶ Takes  $\Theta(n^2)$  space: if  $m$  small, lots wasted!
  - ▶ Iterating through edges incident on  $v$  takes time  $\Theta(n)$ , even if  $d(v)$  small.

This class: adjacency list unless otherwise specified.

Any way to improve these?

- ▶ Replace adjacency *list* with adjacency *structure*: Red-black tree, hash table, etc.
- ▶ Not traditional, doesn't gain us much, and more complicated. But better!

# Breadth-First Search (BFS)

# BFS Definition

Idea: explore graph in *levels* or *layers* from source  $s$

# BFS Definition

# BFS Pseudocode

Idea: explore with a queue (FIFO)

```
BFS( $G = (V, E), s$ ) {  
    Set  $mark(s) = True$ ;  
    Set  $mark(v) = False$  for all  $v \in V \setminus \{s\}$ ;  
    Enqueue( $s$ );  
    while(queue not empty) {  
         $v = Dequeue()$ ;  
        forall neighbors  $u$  of  $v$  {  
            if( $mark(u) == False$ ) {  
                 $mark(u) = True$ ;  
                Enqueue( $u$ );  
            }  
        }  
    }  
}
```

# BFS Pseudocode

Idea: explore with a queue (FIFO)

```
BFS( $G = (V, E), s$ ) {  
    Set  $mark(s) = True$ ;  
    Set  $mark(v) = False$  for all  $v \in V \setminus \{s\}$ ;  
    Enqueue( $s$ );  
    while(queue not empty) {  
         $v = Dequeue()$ ;  
        forall neighbors  $u$  of  $v$  {  
            if( $mark(u) == False$ ) {  
                 $mark(u) = True$ ;  
                Enqueue( $u$ );  
            }  
        }  
    }  
}
```

Running Time:

# BFS Pseudocode

Idea: explore with a queue (FIFO)

```
BFS( $G = (V, E), s$ ) {  
    Set  $mark(s) = True$ ;  
    Set  $mark(v) = False$  for all  $v \in V \setminus \{s\}$ ;  
    Enqueue( $s$ );  
    while(queue not empty) {  
         $v = Dequeue()$ ;  
        forall neighbors  $u$  of  $v$  {  
            if( $mark(u) == False$ ) {  
                 $mark(u) = True$ ;  
                Enqueue( $u$ );  
            }  
        }  
    }  
}
```

Running Time:  $O(n + m)$

# BFS Pseudocode

Idea: explore with a queue (FIFO)

```
BFS( $G = (V, E), s$ ) {  
    Set  $mark(s) = True$ ;  
    Set  $mark(v) = False$  for all  $v \in V \setminus \{s\}$ ;  
    Enqueue( $s$ );  
    while(queue not empty) {  
         $v = Dequeue()$ ;  
        forall neighbors  $u$  of  $v$  {  
            if( $mark(u) == False$ ) {  
                 $mark(u) = True$ ;  
                Enqueue( $u$ );  
            }  
        }  
    }  
}
```

**Running Time:  $O(n + m)$**

- ▶  $O(n)$  for initialization
- ▶  $O(m)$  for main while loop
  - ▶ Examine every edge twice:  
when each endpoint dequeued
  - ▶ Or (equivalent): Adjacency list  
scanned only when vertex  
dequeued

# BFS Pseudocode

Idea: explore with a queue (FIFO)

```
BFS( $G = (V, E), s$ ) {  
    Set  $mark(s) = True$ ;  
    Set  $mark(v) = False$  for all  $v \in V \setminus \{s\}$ ;  
    Enqueue( $s$ );  
    while(queue not empty) {  
         $v = Dequeue()$ ;  
        forall neighbors  $u$  of  $v$  {  
            if( $mark(u) == False$ ) {  
                 $mark(u) = True$ ;  
                Enqueue( $u$ );  
            }  
        }  
    }  
}
```

**Running Time:**  $O(n + m)$

- ▶  $O(n)$  for initialization
- ▶  $O(m)$  for main while loop
  - ▶ Examine every edge twice:  
when each endpoint dequeued
  - ▶ Or (equivalent): Adjacency list  
scanned only when vertex  
dequeued

**Note:** edges that cause a node to be  
enqueued form a tree!

## Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

## Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

**Proof Sketch:** Let  $L_i = \{v : d(s, v) = i\}$ . Claim that layer  $i$  of BFS tree  $T$  equals  $L_i$ .

## Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

**Proof Sketch:** Let  $L_i = \{v : d(s, v) = i\}$ . Claim that layer  $i$  of BFS tree  $T$  equals  $L_i$ .  
Induction on  $i$ .

- ▶ Base case:  $i = 0$ .

## Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

**Proof Sketch:** Let  $L_i = \{v : d(s, v) = i\}$ . Claim that layer  $i$  of BFS tree  $T$  equals  $L_i$ .  
Induction on  $i$ .

- ▶ Base case:  $i = 0$ . ✓

## Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

**Proof Sketch:** Let  $L_i = \{v : d(s, v) = i\}$ . Claim that layer  $i$  of BFS tree  $T$  equals  $L_i$ .  
Induction on  $i$ .

- ▶ Base case:  $i = 0$ . ✓
- ▶ Inductive step: consider  $i > 0$ , let  $v \in L_i$ .

## Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

**Proof Sketch:** Let  $L_i = \{v : d(s, v) = i\}$ . Claim that layer  $i$  of BFS tree  $T$  equals  $L_i$ .  
Induction on  $i$ .

- ▶ Base case:  $i = 0$ . ✓
- ▶ Inductive step: consider  $i > 0$ , let  $v \in L_i$ .  
Shortest  $s - v$  path ends with edge  $\{u, v\}$  with  $u \in L_{i-1}$ .

## Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

**Proof Sketch:** Let  $L_i = \{v : d(s, v) = i\}$ . Claim that layer  $i$  of BFS tree  $T$  equals  $L_i$ .  
Induction on  $i$ .

- ▶ Base case:  $i = 0$ . ✓
- ▶ Inductive step: consider  $i > 0$ , let  $v \in L_i$ .  
Shortest  $s - v$  path ends with edge  $\{u, v\}$  with  $u \in L_{i-1}$ .  
By induction,  $u$  in layer  $i - 1$  of  $T$

# Correctness / Shortest Paths

**Definition:** Distance  $d(u, v)$  from  $u$  to  $v$  is min # edges in any path from  $u$  to  $v$

**Theorem (informal):** BFS( $s$ ) gives shortest paths from  $s$  to all other nodes

**Proof Sketch:** Let  $L_i = \{v : d(s, v) = i\}$ . Claim that layer  $i$  of BFS tree  $T$  equals  $L_i$ .  
Induction on  $i$ .

- ▶ Base case:  $i = 0$ . ✓
- ▶ Inductive step: consider  $i > 0$ , let  $v \in L_i$ .  
Shortest  $s - v$  path ends with edge  $\{u, v\}$  with  $u \in L_{i-1}$ .  
By induction,  $u$  in layer  $i - 1$  of  $T$   
 $\implies \{u, v\} \in T \implies v$  at layer  $i$  of  $T$ .

# Depth-First Search (DFS)

# DFS: Definition

Intuition: Instead of exploring wide (breadth), explore far (deep): just keep walking until see a node we've already seen, then backtrack!

Init: for each  $v \in V$ ,  $mark(v) = False$ ;

```
DFS( $v$ ) {  
     $mark(v) = True$ ;  
    for each edge  $(v, u) \in A[v]$  {  
        if  $mark(u) == False$  then DFS( $u$ );  
    }  
}
```

# DFS: Definition

    }  
}
```

Running time:  $O(m + n)$

- ▶  $O(n)$  initialization
- ▶ Every edge considered at most twice

## DFS: Correctness

**Definition:**  $u$  is *reachable* from  $v$  if there is a path  $v = v_0, v_1, \dots, v_k = u$  such that  $(v_i, v_{i+1}) \in E$  for all  $i \in \{0, 1, \dots, k-1\}$ .

### Theorem

*When  $DFS(v)$  terminates, it has visited (marked) all nodes that are reachable from  $v$ .*

### Proof.

Suppose  $u$  reachable from  $v$  but not marked when  $DFS(v)$  terminates.

## DFS: Correctness

**Definition:**  $u$  is *reachable* from  $v$  if there is a path  $v = v_0, v_1, \dots, v_k = u$  such that  $(v_i, v_{i+1}) \in E$  for all  $i \in \{0, 1, \dots, k-1\}$ .

### Theorem

When  $DFS(v)$  terminates, it has visited (marked) all nodes that are reachable from  $v$ .

### Proof.

Suppose  $u$  reachable from  $v$  but not marked when  $DFS(v)$  terminates.

## DFS: Correctness

**Definition:**  $u$  is *reachable* from  $v$  if there is a path  $v = v_0, v_1, \dots, v_k = u$  such that  $(v_i, v_{i+1}) \in E$  for all  $i \in \{0, 1, \dots, k-1\}$ .

### Theorem

When  $\text{DFS}(v)$  terminates, it has visited (marked) all nodes that are reachable from  $v$ .

### Proof.

Suppose  $u$  reachable from  $v$  but not marked when  $\text{DFS}(v)$  terminates.

$x$  is marked so  $\text{DFS}(x)$  must have been called

## DFS: Correctness

**Definition:**  $u$  is *reachable* from  $v$  if there is a path  $v = v_0, v_1, \dots, v_k = u$  such that  $(v_i, v_{i+1}) \in E$  for all  $i \in \{0, 1, \dots, k-1\}$ .

### Theorem

When  $DFS(v)$  terminates, it has visited (marked) all nodes that are reachable from  $v$ .

### Proof.

Suppose  $u$  reachable from  $v$  but not marked when  $DFS(v)$  terminates.

$x$  is marked so  $DFS(x)$  must have been called

$\implies y$  was either marked or  $DFS(y)$  called and it became marked.

## DFS: Correctness

**Definition:**  $u$  is *reachable* from  $v$  if there is a path  $v = v_0, v_1, \dots, v_k = u$  such that  $(v_i, v_{i+1}) \in E$  for all  $i \in \{0, 1, \dots, k-1\}$ .

### Theorem

When  $\text{DFS}(v)$  terminates, it has visited (marked) all nodes that are reachable from  $v$ .

### Proof.

Suppose  $u$  reachable from  $v$  but not marked when  $\text{DFS}(v)$  terminates.

$x$  is marked so  $\text{DFS}(x)$  must have been called

$\implies y$  was either marked or  $\text{DFS}(y)$  called and it became marked.

Contradiction. □

## Graph variant

After  $\text{DFS}(\mathbf{v})$ , node marked if and only if reachable from  $\mathbf{v}$ .

Might want to continue until all nodes marked.

```
DFS( $\mathbf{G}$ ) {  
  for all  $\mathbf{v} \in \mathbf{V}$ , set  $\text{mark}(\mathbf{v}) = \text{False}$ ;  
  while there exists an unmarked node  $\mathbf{v}$  {  
    DFS( $\mathbf{v}$ );  
  }  
}
```

# Timestamps

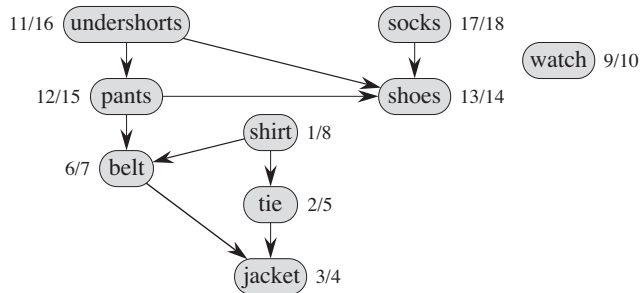

Explicitly keep track of “start” and “finishing” times

- Replaces *mark*

```
DFS( $G$ ) {  
     $t = 0$ ;  
    for all  $v \in V$  {  
         $start(v) = 0$ ;  
         $finish(v) = 0$ ;  
    }  
    while  $\exists v \in V$  with  $start(v) = 0$  {  
        DFS( $v$ );  
    }  
}
```

```
DFS( $v$ ) {  
     $t = t + 1$ ;  
     $start(v) = t$ ;  
    for each edge  $(v, u) \in A[v]$  {  
        if  $start(u) == 0$  then DFS( $u$ );  
    }  
     $t = t + 1$ ;  
     $finish(v) = t$ ;  
}
```

# Timestamp Example

# Edge Types

DFS naturally gives a spanning forest: edge  $(v, u)$  if  $\text{DFS}(v)$  calls  $\text{DFS}(u)$

**Forward Edges:**  $(v, u)$  such that  $u$  is a descendant of  $v$  (includes tree edges)

**Back Edges:**  $(v, u)$  such that  $u$  is an ancestor of  $v$

**Cross Edges:**  $(v, u)$  such that  $u$  is neither a descendant nor an ancestor of  $v$

# Edge Types

DFS naturally gives a spanning forest: edge  $(v, u)$  if  $\text{DFS}(v)$  calls  $\text{DFS}(u)$

**Forward Edges:**  $(v, u)$  such that  $u$  descendent of  $v$  (includes tree edges)

$start(v) < start(u) < finish(u) < finish(v)$

**Back Edges:**  $(v, u)$  such that  $u$  an ancestor of  $v$

**Cross Edges:**  $(v, u)$  such that  $u$  neither a descendent nor an ancestor of  $v$

# Edge Types

# Topological Sort

# Definitions

## Definition

A directed graph  $G$  is a *Directed Acyclic Graph (DAG)* if it has no directed cycles.

# Definitions

## Definition

A directed graph  $G$  is a *Directed Acyclic Graph (DAG)* if it has no directed cycles.

## Definition

A *topological sort*  $v_1, v_2, \dots, v_n$  of a DAG is an ordering of the vertices such that all edges are of the form  $(v_i, v_j)$  with  $i < j$ .

# Definitions

## Definition

A directed graph  $G$  is a *Directed Acyclic Graph (DAG)* if it has no directed cycles.

## Definition

A *topological sort*  $v_1, v_2, \dots, v_n$  of a DAG is an ordering of the vertices such that all edges are of the form  $(v_i, v_j)$  with  $i < j$ .

Q: Can we always topological sort a DAG? How fast?

# Topological Sort

Algorithm (informal): Run  $\text{DFS}(\mathbf{G})$ . When  $\text{DFS}(\mathbf{v})$  returns, put  $\mathbf{v}$  at beginning of list

# Topological Sort

Algorithm (informal): Run  $\text{DFS}(\mathbf{G})$ . When  $\text{DFS}(\mathbf{v})$  returns, put  $\mathbf{v}$  at beginning of list

```
DFS( $\mathbf{G}$ ) {  
    list  $\rightarrow$  head = NULL;  
     $t = 0$ ;  
    for all  $\mathbf{v} \in \mathbf{V}$  {  
        start( $\mathbf{v}$ ) = 0;  
        finish( $\mathbf{v}$ ) = 0;  
    }  
    while  $\exists \mathbf{v} \in \mathbf{V}$  with start( $\mathbf{v}$ ) = 0 {  
        DFS( $\mathbf{v}$ );  
    }  
}
```

```
DFS( $\mathbf{v}$ ) {  
     $t = t + 1$ ;  
    start( $\mathbf{v}$ ) =  $t$ ;  
    for each edge  $(\mathbf{v}, \mathbf{u}) \in \mathbf{A}[\mathbf{v}]$  {  
        if start( $\mathbf{u}$ ) == 0 then DFS( $\mathbf{u}$ );  
    }  
     $t = t + 1$ ;  
    finish( $\mathbf{v}$ ) =  $t$ ;  
    temp = list  $\rightarrow$  head;  
    list  $\rightarrow$  head =  $\mathbf{v}$ ;  
    list  $\rightarrow$  head  $\rightarrow$  next = temp;  
}
```

# Characterizing DAGs

## Theorem

*A directed graph  $G$  is a DAG if and only if  $\text{DFS}(G)$  has no back edges.*

# Characterizing DAGs

## Theorem

*A directed graph  $G$  is a DAG if and only if  $DFS(G)$  has no back edges.*

## Proof.

Only if ( $\Rightarrow$ ): contrapositive. If  $G$  has a back edge:

# Characterizing DAGs

## Theorem

*A directed graph  $G$  is a DAG if and only if  $\text{DFS}(G)$  has no back edges.*

## Proof.

Only if ( $\Rightarrow$ ): contrapositive. If  $G$  has a back edge: Directed cycle! Not a DAG.

# Characterizing DAGs

## Theorem

*A directed graph  $G$  is a DAG if and only if  $DFS(G)$  has no back edges.*

## Proof.

Only if ( $\Rightarrow$ ): contrapositive. If  $G$  has a back edge: Directed cycle! Not a DAG.

If ( $\Leftarrow$ ): contrapositive. If  $G$  has a directed cycle  $C$ :

# Characterizing DAGs

## Theorem

A directed graph  $G$  is a DAG if and only if  $\text{DFS}(G)$  has no back edges.

## Proof.

Only if ( $\Rightarrow$ ): contrapositive. If  $G$  has a back edge: Directed cycle! Not a DAG.

If ( $\Leftarrow$ ): contrapositive. If  $G$  has a directed cycle  $C$ :

- ▶ Let  $u \in C$  with minimum start value,  $v$  predecessor in cycle
- ▶ All nodes in  $C$  reachable from  $u \implies$  all nodes in  $C$  descendants of  $u$
- ▶  $(v, u)$  a back edge

# Topological Sort Analysis

**Correctness:** Since  $G$  a DAG, never see back edge

- ⇒ Every edge  $(v, u)$  out of  $v$  a forward or cross edge
- ⇒  $finish(u) < finish(v)$
- ⇒  $u$  already in list when  $v$  added to beginning

# Topological Sort Analysis

**Correctness:** Since  $G$  a DAG, never see back edge

⇒ Every edge  $(v, u)$  out of  $v$  a forward or cross edge

⇒  $finish(u) < finish(v)$

⇒  $u$  already in list when  $v$  added to beginning

**Running Time:** Same as DFS!  $O(m + n)$
